window films*

**Protection for
your home.**

Another great 3M product you can trust.

No one has more experience with window film than 3M. In 1966, we received the first patent for window film. For decades, 3M has remained a world leader in the development of new and innovative adhesives and films. Today there are millions of square feet of 3M™ Window Films installed all around the world. With these films, we have once again demonstrated why we are an industry leader.

Ultra protection with ultra performance.

Protecting people and property with 3M™ Safety & Security Window films.

Sometimes the threat from nature, other times people. No matter where the threat comes from, 3M™ Safety & Security Window Films can help you be prepared for the worst.

Our thin film gives you a wider margin of safety.

The strength of a film is not only dependent on its thickness. By using layer after layer of micro-thin polyester films, our film outperforms other films of similar thickness. This superior performance is due to the remarkable flexibility of our film. So while other films tear, ours merely stretches and, depending upon the application system, can help keep the window in the frame even when the glass breaks.

Another advantage of our film is that it is bonded to the glass with advanced 3M adhesives. So when the glass breaks, the shards are held together by the film to help reduce the chance of injury. And 3M™ Impact Protection Attachment System improves the overall performance of 3M Safety & Security Window Films.

Tested and retested.

Our films have been subjected to bomb blasts and a rigorous series of durability tests. We have gone to extreme measures to make sure our films meet or exceed industry standards for impact and tear resistance.*

*GSA explosive blast standards for glazing.

Protection for your business.

Bomb blasts.

As unpleasant as it might be to consider, the threat of bomb blasts in this world is very real. Like natural disasters, a bomb blast also turns unprotected glass into dangerous flying shards. 3M™ Safety & Security Window Films have proven in real-world situations to have mitigated the damage from bomb blasts and helped protect occupants. And our 3M Impact Protection Attachment System aggressively bonds the glass and film to the window frame.

Street crime.

3M™ Safety & Security Window Films also helps provide added protection to property from smash and grab burglaries. Recent testing has shown 3M Security Films & Attachment Systems can resist attack and deter an intruder for as long as two minutes. This can give you valuable time to prepare and my discourage the intruder from entering all together.

Protection from the sun.

Damage from the sun.

Over time, the powerful UV rays of the sun can do enormous damage to merchandise, upholstery, carpet, wallpaper, window treatments and wood. You can always pull the blinds, but what is the use of having windows if you can't enjoy the view?

3M™ Window Films are designed to reduce the effects of solar heat and visible light on your furnishings and blocks up to 99% of the sun's harmful ultraviolet rays, which are the single largest cause of fading. While no film can stop fading completely, our films dramatically slow the progress of fading.

Discomfort from the sun.

Sun control problems can also make keeping a home or building comfortable a difficult job. 3M™ Window Films help to eliminate hot spots in your home where windows contribute greatly to the temperature of the room. And window film can help keep your air conditioner from working overtime. The Prestige Series has the added feature of blocking up to 63% of the heat of the sun and reducing the glare. Our window films not only help reduce glare and eye discomfort but also help reduce air conditioning costs.

Clearly superior window films for clearly superior performance.

A new standard of performance metallic films cannot match.

Until recently, most window films that rejected heat were tinted dark, used metal or were highly reflective. Over the years, various other companies have tried to create a clear window film with mixed results. While they were able to achieve improved performance, their drawbacks made them unacceptable for many applications. Because these films used metal, they were susceptible to corrosion, especially in coastal environments. Because the Prestige Series has no metals, they are the first films to eliminate this problem and perform to the industry's highest standards.

With Prestige Series, your home's exterior stays beautiful and from the interior, your view is as clear as your original window.

Reflectivity that's actually lower than glass.

One of the major drawbacks of traditional window films is that they tend to act like mirrors. Our Prestige Series has substantially reduced interior reflectivity. This premium line has interior reflectivity that is less than, or just 1% greater than glass.

Superior heat rejection throughout the day.

These films selectively reject up to 97% of the sun's infrared heat to help keep you comfortable and lower your energy bills. And unlike other films that can only achieve similar performance during the cool times of sunrise and sunset, these films improve throughout the day and especially during the hottest times when you need the help most. Compared to other window films, the Prestige Series has the highest increase in solar protection during the hottest times. So, when the sun is working hardest, our films are performing at their best.

Optically clear. Technically superior.

Creating a clear window film with all these advantages wasn't easy. It required the development of nano-technology in the laboratories of 3M. Nano-technology works with materials that are over 1,000 times smaller than the width of a hair. This expertise allows us to create a window film with hundreds of layers that is less than the thickness of a Post-it® Note.
